

Tactical Emergency Casualty Care

TECC focuses on the prehospital medicine during three phases of care and provides guidelines for managing trauma in the civilian tactical or hazardous environment. While TECC has a tactical (i.e. “Human Threat”) focus, it takes an all-hazards approach to providing care outside the normal operating conditions of most EMS agencies, such as responding to a mass casualty or active shooter event.

NAEMT's Tactical Emergency Casualty Care (TECC) teaches EMS practitioners and other prehospital providers how to respond to and care for patients in a civilian tactical environment. It is designed to decrease preventable deaths in a tactical situation. The course presents the three phases of tactical care:

- Direct Threat Care that is rendered while under attack or in adverse conditions.
- Indirect Threat Care that is rendered while the threat has been suppressed, but may resurface at any point.
- Evacuation Care that is rendered while the casualty is being evacuated from the incident site.

Case studies, complex integrated scenarios and more make this an exciting change from traditional training programs. The 16-hour course covers the following topics:

- Hemorrhage control - Tourniquets, Wound Packing, Hemostatic Dressings;
- Surgical airway control and needle decompression;
- Strategies for treating wounded responders in threatening environments;
- Mass casualty incidents and casualty collection points;
- Techniques for dragging and carrying victims to safety; and
- Dynamic scenario integration.

NAEMT's TECC course meets the guidelines established by the **Committee on TECC** and the updated **National Tactical Emergency Medical Support Competency Domains**. This course is accredited by CAPCE and recognized by NREMT.
